

What is claimed is:

1. A management system comprising:

a holding device which holds data;

a processing device which execute specific processing of data held by the holding device; and

a storage device which receives and stores data from the processing device,

wherein the holding device is provided with a first transceiver for communication with the processing device, data memory for storing data, and ID information memory for storing ID information identifying the holding device, and wherein the processing device is provided with a second transceiver for communication with the holding device, and a processor for reading data from the data memory through the second transceiver and classifying the data based on the ID information, and wherein the storage device stores data classified by the processor of the processing device and its corresponding ID information.

2. A management system according to claim 1, wherein said processor of the processing device accesses data stored in the storage device based on ID information read from the data memory of the holding device through the second transceiver.

3. A management system according to claim 1, wherein said holding device is a digital camera which photographs an object and generates and stores digital image data.

4. A management system according to claim 1, wherein said storage device is provided within the processing device.

5. A management system according to claim 1, wherein said processing device is provided with a printing mechanism for printing data read from the storage device.

6. A management system according to claim 5, wherein said printing mechanism print data after the read data are subjected to specific processing based on ID information read from the data memory of the holding device.

7. A management system according to claim 1, wherein said processing device and said storage device are connected to a communication network.

8. A management system according to claim 1, wherein said ID information is a unique identification number identifying the holding device.

9. A management system according to claim 1, wherein said processor of the processing device allocates a memory area of the storage device to each unique identification number, and said storage device stores data in the corresponding memory area in accordance with the unique identification number.

10. A data management device comprising:

a data processor which receives and processes data from a data holding device; and

a memory for stores data received the data processor,  
wherein the data processor is provided with a

transceiving unit for communication with the data holding device, and a classification processing means for reading data from the data holding device through the transceiving means and classifying the data based on ID information identifying the data holding device, and wherein the memory stores data classified by the classification processing means corresponding to the ID information.

11. A data management method comprising the steps of:

communicating with data holding device and identifying ID information of the data holding device;

classifying data received from the data holding device based on the ID information; and

storing data classified in the classification step corresponding to the ID information.

12. A recording medium which stores a computer program for executing management comprising a step of:

communicating with data holding device and identifying ID information of the data holding device;

classifying data received from the data holding device based on the ID information; and

storing data classified in the classification step corresponding to the ID information.
